

NEW JOKER BUG KITS : IT'S MORE THAN JUST A NEW CASE.

Of course, there is the obvious change of case. Not only, it is a different color but it is also smaller.

There are more important improvements in the 2009 Vintage:

New 200/400 and 800 Ballasts are now available.

They offer the following features:

1) PFC: Power Factor Correction means that your fixture is drawing exactly what it is supposed to. No need to add an extra 50% to be on "the safe side": A 400 W ballast draws 400W.

2) The Low Frequency Technology is actually dissipating less heat than the previous techniques. As a result, there is no more need for a fan in the 800 W. Sound engineers will be pleased.

3) Weather resistance improved greatly: No fan to "breath in" humidity, and no open slots of any kind.

4) The hot restrike process is also improved.

New yoke base.

Adding a 45° angle to the existing vertical and horizontal position. The 45° position brings more tilt to the head which is greatly appreciated especially with a light bank.

New back cover.

Made of aluminium casting, this new back cover not only gives sturdiness to the Joker Bug light, but it also reduces the noise of aging igniters.
